How to run pc apps on android phone. How to use mobile apps on pc. How to run pc apps on mobile. Can i run mobile apps on my pc. How to use your phone apps on pc.

A huge community of gamers love to play mobile games but let's just admit it, nothing beats the excitement of playing thrilling mobile games on a larger display. Similarly, it's much more convenient to manage your mobile apps via mouse and keyboard. Luckily, the internet is awash with software that allows users to run Android apps on PC seamlessly. Thanks to these tools, anyone can easily manage Android mobile apps on a computer using a mouse and keyboard. Here are our top picks for how to run Android apps on your PC or Mac without any lag. If you're looking for the most efficient and user-friendly tool to run your favorite Android apps on a larger display, then AirDroid Personal is your ideal companion. It is a lightweight yet powerful screen mirroring app that offers a click-through process to connect your Android and PC and then manage all apps via mouse and keyboard. What makes it our top pick is the lag-free experience users get to play Android games as well as seamlessly run every Android app installed on their smartphone. Unlike its competitors, AirDroid Personal doesn't require you to root or jailbreak your Android device. Its other features empower you to transfer files across platforms, use an Android camera remotely, manage your SMS, calls, and other mobile notifications from your PC. Additionally, you can control an Android device from another Android or iOS device. Thanks to its sleek and modern interface, it's a go-to option for both beginners and pro users. Run Android apps on your computer smoothly. Provides a seamless connection between Android and PC. Use mouse and keyboard to play Android games. Transfer files between Windows, Mac, Linux, iOS and Android devices. Comes with a built-in screen recorder to capture your Android phone's screen. Users can remotely access the remote camera of another Android which comes as a handy security feature. Benefits: Compatible with all Android phones and Windows versions. Beginner-friendly interface. Supports non-root devices. Comes at a low cost of just \$3.99/month. Check out how to run Android apps on PC without any emulator: Step 1. To begin, install and launch AirDroid Personal App on your Android device. Then, sign in/sign up with your AirDroid account. Step 2. After that, follow the on-screen instructions to allow AirDroid Personal to use your Android device. Note: This step appears only the first time when you're using this program. Step 3. Now, download AirDroid Personal Client on your PC. Sign in with the same AirDroid account you used on Android device. Step 4. After that, launch the desktop client and hit the Telescope icon in the left bar. The program will show the mobile devices synced with the same account. Step 5. Here, select your Android device and hit on "Remote Control" to establish the connection. Step 6. Once the connection is established, you can easily run all the Android apps through the remote control feature on your PC. Another efficient way to run Android apps on a PC is via Android emulators. These tools are designed specifically to empower users manage their Android phones from a big screen. All you need to do is install competent emulator on your PC, install the apps through its own Google Play Store, and start using them via mouse and keyboard. Use BlueStacks. The internet is awash with powerful Android emulators but none of them comes close to what BlueStacks brings for users. It is the fastest and best app to run Android games on PC without going through any tech-savvy procedure. BlueStacks is full of Android apps but it shines when it comes to playing Android games. The emulator comes loaded with mappings for your mouse that you can easily customize as needed. Text Guide: Check out how to run Android apps on PC Windows 10: Step 1. Head to BlueStacks.com and install the latest version on your PC. Step 2. After launching it, sign in to your Google account to get started. Step 3. Now, open the BlueStacks Google Play Store and search for the Android app you want to run. Then, select install to download them within the BlueStacks app. Step 4. You'll see all the installed apps on the BlueStacks home screen. Start using them as you wish. Now that you know both BlueStacks and AirDroid Personal are efficient software to run Android apps on Windows 7 PC, it's time to decide which app you should prefer. Based on users' feedback and our own research, AirDroid Personal is your perfect choice for enjoying Android apps on a larger display. Installing and setting it up is so easy that even an 80-year granny or a 10-year kid won't face any issue in it. Also, you don't need to install any app on your PC that you want to run, which saves quite a lot of time and effort. On the contrary, installing and setting up emulators itself is a heck of a task. For instance, the latest version of BlueStacks consumes around 5GB of your hard drive that can put a lot of strain on CPU resources. Plus, such tools make your PC slow and often laggy particularly while playing a graphic-demanding game. That's why we recommend users to always rely on AirDroid Personal to manage their smartphones from the computer. With the impeccable features it offers at such a user-friendly price, it is rightly considered the best way to run Android apps on PC. To sum up, running Android apps on a big screen has never been easier with all the amazing screen mirroring apps and Android emulators available in 2022. This article concludes that AirDroid Personal Client is the best app to run Android on PC seamlessly. Additionally, it allows users to customize the mouse and keyboard settings as easily as it can get. However, the final choice is yours to select whichever tool you like to run Android apps on PC. Can Android apps run on Windows PC? Yes, users can run and manage Android apps on a PC using AirDroid Personal. First, you need to install the apps on your Android phone and then, use this remarkable software to screencast your Android device on the PC. Once a connection is established, users can run apps and play games seamlessly as well as transfer data between devices. How to Run Android Apps on PC Online Use AirDroid web to run Android apps on your PC browser and manage your notifications and other controls via mouse and keyboard. You have to install the mobile version of AirDroid app on your Android device to remotely access it from PC online. Is BlueStacks a safe efficient software to run Android apps on Windows 10 PC? For most people, BlueStacks is a go-to emulator for running Android apps on a PC. This emulator is particularly useful for playing Android games on a big screen but it can slow down low-end PCs and saggy at times. So, use AirDroid Personal to play Android games as well as run Android apps on a larger display consistently and smoothly. Android has grown to become the largest computing platform on Earth, and this has led to a plethora of cool Android apps, some of which aren't available on iOS or other platforms. Even in this age of giant phones, you might occasionally want to use those apps on a bigger screen, like the one connected to your Windows PC. Fortunately, with a little leg work, you can run Android apps on a PC. There are a few different ways to go about it, each with its own strengths and weaknesses. Android Studio One popular way to get Android apps running on a PC is to go through the Android emulator released by Google as part of the official Android Studio. The emulator can be used to create virtual devices running any version of Android you want with different resolutions and hardware configurations. This is a developer-oriented approach, so the setup process is a bit complicated. You'll need to grab the installer from Google's site and run through the setup process to download the platforms you want — probably whatever the most recent version of Android happens to be at the time (7.1 at the time of publishing). Google has some pre-configured emulation options available in the menu for Nexus/Pixel devices, but you can set the parameters manually, too. Once you've booted your virtual device, you'll need to get apps installed, but the emulator is the bone stock open source version of Android — no Google apps included. Since there's no Play Store, you need to do some file management. Take the APK you want to install (be it Google's app package or something else) and drop the file into the tools folder in your SDK directory. Then use the command prompt while your AVD is running to enter (in that directory) adb install filename.apk. The app should be added to the app list of your virtual device. The big upside here is that the emulator is unmodified Android right from the source. The way apps render in the emulator will be the same as they render on devices, and almost everything should run. It's great for testing app builds before loading them onto test devices. The biggest problem is that the emulator is sluggish enough that you won't want to make a habit of running apps in it. Games are out of the question as well. BlueStacks BlueStacks presents itself as just a way to run apps, but it actually runs a full (heavily modified) version of Android behind the scenes. Not only that, but it has the Play Store built-in, so you have instant access to all of your purchased content. It actually adds an entry to your Google Play device list, masquerading as an Android phone. The BlueStacks client will load up in a desktop window with different app categories like games, social, and so on. Clicking on an app or searching does something unexpected — it brings up the full Play Store client as rendered on tablets. You can actually navigate around in this interface just as you would on a real Android device, which makes it clear there's a lot more to BlueStacks than the "App Player" front end. The main screen in BlueStacks with the app categories is just a custom home screen, so replacing it makes BlueStacks feel almost like a regular Android device. Having full Play Store access means you won't be messing around with sideloading apps, and BlueStacks manages to run apps pretty well (and better if you have a CPU that supports hardware virtualization). Most games are playable, but keep in mind you'll have trouble operating many of them with a mouse. If your PC has a touch screen, you can still use apps and games that rely on more than one touch input. BlueStacks can essentially make a Windows tablet PC into a part-time Android tablet. The biggest issue with BlueStacks is that it's not running a standard Android build. All the alterations the company made to get apps working on a PC can cause issues — some apps fail to run or crash unexpectedly. This customized environment is also of little value as a development tool because there's no guarantee things will render the same on BlueStacks as they might on a real Android device without all the back-end modifications. It's also a freemium service with a \$2 pro subscription, or you can install a few sponsored apps. Windows Subsystem for Android If you're looking to get multiple apps and games up and running on your computer with the minimum of effort, you'll want to be on Windows 11. Microsoft has partnered with Amazon to deploy the Windows Subsystem for Android, which is able to run Android apps on any sufficiently powerful PC. All you have to do to get started is open the (beta) Amazon Appstore client on Windows and sign in. Amazon's Appstore for Android is light on desirable apps even on a phone, and the Windows 11 beta has even fewer apps available. However, it's built into Windows and works pretty well. Performance is never amazing, but it's about the same whether you're using the Kindle app or playing a 3D game. Because the Windows Subsystem for Android is integrated with the system, you can use it to sideload and run apps from outside of Amazon's store. Keep in mind that some apps require Google's mobile services framework, which is not present in Windows. Plenty of apps still work, though. The first step in sideloading an app is to find the APK installer. I prefer to use APK Mirror, a reputable site with a huge database of free apps. Find the Android subsystem settings in Windows, and enable Developer Mode. This page should also show an IP address that you'll need later. Next, you will have to download Google's SDK Platform Tools, which will allow you to connect to the virtual Android machine in Windows. Next, you have to open a command prompt in the platform tools folder and connect to Android with adb connect IP address, using the IP address from above. Then you can simply use adb install file\_path, using the path to the APK file you downloaded. Some systems will require you to specify the IP address again as seen below. Sideloading Android apps appear in your Windows app list just like apps installed via the Amazon Appstore. Link to Windows Some Android phones (mostly Samsung devices) have enhanced support for Microsoft's Your Phone Windows client, offering access to your messages, notifications, photos, and yes, apps. The apps aren't technically running on the PC — they're mirrored from your phone. However, this system is very fleshed out and officially supported. Everything else we've talked about so far is limited or not for regular users, but you can be up and running with Link to Windows in a few minutes. You will need a phone that works with the latest Your Phone features. That includes the Samsung Galaxy S9 and newer, as well as the Microsoft Surface Duo. The feature will expand to more phones in the future, though. First, make sure you've got the Your Phone app on your Windows PC. Next, launch the Link to Windows client on your Samsung phone — it should be accessible under Advanced Features and from the quick settings. You'll have to scan a QR code on your computer with the phone and sign into your Microsoft account. And that's it. Your app list appears in the Your Phone app, and you can launch any of them. Your phone doesn't need to be plugged in, but Wi-Fi is recommended. Supported devices running Android 11 can run multiple apps side-by-side on Windows, but be aware that less powerful phones will be sluggish with more than one simultaneous app. Because the apps are running on your phone, you don't have to worry about incompatibility or missing Google components like you do with the Windows Subsystem for Android. So What's the Best Way? If you need to test something with the intention of putting it on other Android devices, the emulator is still the best way. This is best suited to developers as the configuration and management of apps is complicated. It's slow, but you'll be able to see how things will work on the real deal. If you're interested in getting more than a handful of apps running on your PC so you can actually use and enjoy them, the Windows Subsystem for Android is the best solution for most people. If you happen to have a phone compatible with Microsoft's latest Your Phone features, that's by far the easiest way to get Android apps on your PC. Many of these phones are expensive, so it's not worth buying one just for this single use case. However, if you're due for an upgrade and running Android apps on a PC is on your list of priorities, this might influence your decision. I still don't think you should buy the Surface Duo, though.
